

Encode voice-quality streaming audio from phone: a server based solution

Server may not be as shown. Actual server is built with best available brand-name components or to client specs.

For a demonstration of AudioMail™ please visit www.audio-mail.com. ↙

AudioMail™ is a server-based Interactive Voice Response system that receives phone calls and encodes in real-time into the Clipstream™ Audio Java® streaming format, providing interactive voice feedback and touch-tone menu system. Sampled at 8KHz mono, the output is voice-quality, optimized for easy playback from internet sources.

The AudioMail™ components

AudioMail™ is in three components: the AudioMail™ server software, licensed Clipstream™ Audio codecs (included) and an IVR server that accepts incoming telephone calls. To deploy AudioMail™ clients can choose a hosted solution maintained by AudioMail™ or may choose to purchase the CS-1400 Server for hosting within the client's own architecture.

The CS-1400 AudioMail™ server

The AudioMail™ server may be rackmounted or a standalone box. All servers are custom-built and tested by the AudioMail™ team from best available brand-name components based upon client specifications. Below is an example of an IVR system built for AudioMail™.

Features	Server & Software	Support & Warranty
<ul style="list-style-type: none">■ auto-encoding voice from phone■ plugs into database■ CGI-scripting for email delivery■ existing user registration / login / password retrieval■ audio clips library■ voice-to-blog posting■ customizable interface	<ul style="list-style-type: none">■ 3.0 Xeon■ 1GB RAM■ 2x160GB SATA Hard drive (RAID 1)■ IVR modem card■ Windows® Server 2003 Web Edition■ CD Drive■ Clipstream™ Audio codecs■ AudioMail™ IVR software■ Pre-programmed phone	<ul style="list-style-type: none">■ Server build & testing■ Software installation■ Free delivery■ Manual & online support■ <i>optional</i>: one-year full parts & software/hardware warranty■ <i>optional</i>: phone support■ <i>optional</i>: hosted solution.
